# Recommendations\_with\_IBM

November 24, 2021

### 1 Recommendations with IBM

In this notebook, you will be putting your recommendation skills to use on real data from the IBM Watson Studio platform.

You may either submit your notebook through the workspace here, or you may work from your local machine and submit through the next page. Either way assure that your code passes the project RUBRIC. Please save regularly.

By following the table of contents, you will build out a number of different methods for making recommendations that can be used for different situations.

#### 1.1 Table of Contents

I. Section ?? II. Section ?? IV. Section ?? V. Section ?? VI. Section ??

At the end of the notebook, you will find directions for how to submit your work. Let's get started by importing the necessary libraries and reading in the data.

```
In [1]: import pandas as pd
        import numpy as np
        import matplotlib.pyplot as plt
        import seaborn as sns
        import project_tests as t
        import pickle
        %matplotlib inline
        df = pd.read_csv('data/user-item-interactions.csv')
        df_content = pd.read_csv('data/articles_community.csv')
        del df['Unnamed: 0']
        del df_content['Unnamed: 0']
        # Show df to get an idea of the data
        df.head()
Out[1]:
                                                                    title \

#### 1.1.1 Part I: Exploratory Data Analysis

Use the dictionary and cells below to provide some insight into the descriptive statistics of the data.

- 1. What is the distribution of how many articles a user interacts with in the dataset? Provide a visual and descriptive statistics to assist with giving a look at the number of times each user interacts with an article.
  - a. Exploratory analysis about "number of users interact with an article"

# • Number of times each user interacts with an article

In [6]: df.groupby(['article\_id','email']).size()

Out[6]:	article_id	email 2841916b462a2b89d36f4f95ca2d1f42559a5788 384255292a8223e84f05ca1e1deaa450c993e148	1

### using Seaborn for seeing better distribution

• Cumulative distribution statistics of "how many articles a user interacts with" (use Mathplotlib because seaborn ver 0.8.1 doesnot support histplot)

```
In [15]: plt.hist(user_interact_unique, bins = 100, ec="yellow", fc="green", cumulative = True)
Out[15]: (array([ 2309.,

Out[26]: 45993
In [27]: unique_articles = 714 # The number of unique articles that have at least one interaction
         total_articles = 1051 # The number of unique articles on the IBM platform
         unique_users = 5148 # The number of unique users
         user_article_interactions = 45993 # The number of user-article interactions
```

4. Use the cells below to find the most viewed **article\_id**, as well as how often it was viewed. After talking to the company leaders, the <code>email\_mapper</code> function was deemed a reasonable way to map users to ids. There were a small number of null values, and it was found that all of these null values likely belonged to a single user (which is how they are stored using the function below).

```
In [28]: # The most viewed article in the dataset was viewed how many times?
         df.groupby(['article_id']).size().max()
Out[28]: 937
In [29]: article_interactions = df.groupby(['article_id']).size()
         article_interactions
Out[29]: article_id

```

It looks like you have everything right here! Nice job!

#### 1.1.2 Part II: Rank-Based Recommendations

Unlike in the earlier lessons, we don't actually have ratings for whether a user liked an article or not. We only know that a user has interacted with an article. In these cases, the popularity of an article can really only be based on how often an article was interacted with.

- 1. Fill in the function below to return the  $\bf n$  top articles ordered with most interactions as the top. Test your function using the tests below.
  - Draft the functions with n = 10

```

### 1.1.3 Part III: User-User Based Collaborative Filtering

- 1. Use the function below to reformat the **df** dataframe to be shaped with users as the rows and articles as the columns.
  - Each **user** should only appear in each **row** once.
  - Each **article** should only show up in one **column**.
  - If a user has interacted with an article, then place a 1 where the user-row meets for that article-column. It does not matter how many times a user has interacted with the article, all entries where a user has interacted with an article should be a 1.
  - If a user has not interacted with an item, then place a zero where the user-row meets for that article-column.

Use the tests to make sure the basic structure of your matrix matches what is expected by the solution.

a. Draft the function

```
In [49]: df.head()
```

```

[5149 rows x 714 columns]

### b. Fill in the function

```
df - pandas dataframe with article_id, title, user_id columns

OUTPUT:
    user_item - user item matrix

Description:
    Return a matrix with user ids as rows and article ids on the columns with 1 values an article and a 0 otherwise
    '''

# Fill in the function here
    interactions = df.groupby(['user_id','article_id']).size()
    df_interactions = df.groupby(['user_id','article_id']).size().index.to_frame()
    df_interactions['interaction'] = interactions
    user_item = df_interactions.pivot(*df_interactions.columns).fillna(0)
    user_item [user_item * return the user_item matrix

user_item = create_user_item_matrix(df)
```

c. Test the function

INPUT:

```
In [61]: ## Tests: You should just need to run this cell. Don't change the code.
    assert user_item.shape[0] == 5149, "Oops! The number of users in the user-article matr
    assert user_item.shape[1] == 714, "Oops! The number of articles in the user-article mate
    assert user_item.sum(axis=1)[1] == 36, "Oops! The number of articles seen by user 1 do
    print("You have passed our quick tests! Please proceed!")
```

You have passed our quick tests! Please proceed!

2. Complete the function below which should take a user\_id and provide an ordered list of the most similar users to that user (from most similar to least similar). The returned result should not contain the provided user\_id, as we know that each user is similar to him/herself. Because the results for each user here are binary, it (perhaps) makes sense to compute similarity as the dot product of two users.

Use the tests to test your function.

a. Draft the function

Computes the similarity of every pair of users based on the dot product

In [62]: # check the user\_item matrix and its dimensions
 user\_item

- 4. Now we are going to improve the consistency of the user\_user\_recs function from above.
- Instead of arbitrarily choosing when we obtain users who are all the same closeness to a given user choose the users that have the most total article interactions before choosing those with fewer article interactions.
- Instead of arbitrarily choosing articles from the user where the number of recommended articles starts below m and ends exceeding m, choose articles with the articles with the most total interactions before choosing those with fewer total interactions. This ranking should be what would be obtained from the **top\_articles** function you wrote earlier.
- a. Draft the functions
- The neighbor data frame including the neighbor's similarity and the number of articles viewed by the neighbor

Calculate the neighbor's similarity

If this is all you see, you passed all of our tests! Nice job!

                    242
In [117]: ### Tests with a dictionary of results
          user1 most sim = 3933 # Find the user that is most similar to user 1
          user131 10th sim = 242 # Find the 10th most similar user to user 131
In [118]: ## Dictionary Test Here
          sol 5 dict = {
              'The user that is most similar to user 1.': user1_most_sim,
              'The user that is the 10th most similar to user 131': user131_10th_sim
          }
          t.sol_5_test(sol_5_dict)
This all looks good! Nice job!
```

6. If we were given a new user, which of the above functions would you be able to use to make recommendations? Explain. Can you think of a better way we might make recommendations? Use the cell below to explain a better method for new users.

## Provide your response here.

7. Using your existing functions, provide the top 10 recommended articles you would provide for the a new user below. You can test your function against our thoughts to make sure we are all on the same page with how we might make a recommendation.

The above result is ok because with a new user we cannot calculate the similarity of existing users to the new user.

```
In [120]: get_top_sorted_users(new_user, df, user_item).head()
```

```
Out[120]:
                      user_id similarity num_interactions
              22
                            {\tt NaN}

           '1314.0',
           '1293.0',
           '1170.0',
           '1162.0',
           '1304.0']
```

Or an existing function in Part II can be used to get this article ids list

```
'1293.0',
           '1170.0',
           '1162.0',
           1304.01
   Fill in the result
In [125]: new_user = '0.0'
          # What would your recommendations be for this new user '0.0'? As a new user, they hav
          # Provide a list of the top 10 article ids you would give to
          new_user_recs = ['1429.0',
           '1330.0',
           '1431.0'.
           '1427.0',
           '1364.0',
           '1314.0'.
           '1293.0',
           '1170.0',
           '1162.0',
           '1304.0'] # Your recommendations here
In [126]: assert set(new_user_recs) == set(['1314.0','1429.0','1293.0','1427.0','1162.0','1364.0
          print("That's right! Nice job!")
That's right! Nice job!
```

# 1.1.4 Part IV: Content Based Recommendations (EXTRA - NOT REQUIRED)

Another method we might use to make recommendations is to perform a ranking of the highest ranked articles associated with some term. You might consider content to be the **doc\_body**, **doc\_description**, or **doc\_full\_name**. There isn't one way to create a content based recommendation, especially considering that each of these columns hold content related information.

1. Use the function body below to create a content based recommender. Since there isn't one right answer for this recommendation tactic, no test functions are provided. Feel free to change the function inputs if you decide you want to try a method that requires more input values. The input values are currently set with one idea in mind that you may use to make content based recommendations. One additional idea is that you might want to choose the most popular recommendations that meet your 'content criteria', but again, there is a lot of flexibility in how you might make these recommendations.

# 1.1.5 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

```
In [ ]: def make_content_recs():
```

'1314.0',

INPUT:
OUTPUT:

- 2. Now that you have put together your content-based recommendation system, use the cell below to write a summary explaining how your content based recommender works. Do you see any possible improvements that could be made to your function? Is there anything novel about your content based recommender?
- 1.1.6 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

Write an explanation of your content based recommendation system here.

- 3. Use your content-recommendation system to make recommendations for the below scenarios based on the comments. Again no tests are provided here, because there isn't one right answer that could be used to find these content based recommendations.
- 1.1.7 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

```
In []: # make recommendations for a brand new user

# make a recommendations for a user who only has interacted with article id '1427.0'
```

#### 1.1.8 Part V: Matrix Factorization

In this part of the notebook, you will build use matrix factorization to make article recommendations to the users on the IBM Watson Studio platform.

1. You should have already created a **user\_item** matrix above in **question 1** of **Part III** above. This first question here will just require that you run the cells to get things set up for the rest of **Part V** of the notebook.

2. In this situation, you can use Singular Value Decomposition from numpy on the user-item matrix. Use the cell to perform SVD, and explain why this is different than in the lesson.

```
In [ ]: # Perform SVD on the User-Item Matrix Here
     u, s, vt = # use the built in to get the three matrices
```

#### Provide your response here.

3. Now for the tricky part, how do we choose the number of latent features to use? Running the below cell, you can see that as the number of latent features increases, we obtain a lower error rate on making predictions for the 1 and 0 values in the user-item matrix. Run the cell below to get an idea of how the accuracy improves as we increase the number of latent features.

```
In []: num_latent_feats = np.arange(10,700+10,20)
        sum_errs = []
        for k in num_latent_feats:
            \# restructure with k latent features
            s_new, u_new, vt_new = np.diag(s[:k]), u[:, :k], vt[:k, :]
            # take dot product
            user_item_est = np.around(np.dot(np.dot(u_new, s_new), vt_new))
            # compute error for each prediction to actual value
            diffs = np.subtract(user_item_matrix, user_item_est)
            # total errors and keep track of them
            err = np.sum(np.sum(np.abs(diffs)))
            sum_errs.append(err)
        plt.plot(num_latent_feats, 1 - np.array(sum_errs)/df.shape[0]);
        plt.xlabel('Number of Latent Features');
        plt.ylabel('Accuracy');
        plt.title('Accuracy vs. Number of Latent Features');
```

4. From the above, we can't really be sure how many features to use, because simply having a better way to predict the 1's and 0's of the matrix doesn't exactly give us an indication of if we are able to make good recommendations. Instead, we might split our dataset into a training and test set of data, as shown in the cell below.

Use the code from question 3 to understand the impact on accuracy of the training and test sets of data with different numbers of latent features. Using the split below:

- How many users can we make predictions for in the test set?
- How many users are we not able to make predictions for because of the cold start problem?
- How many articles can we make predictions for in the test set?
- How many articles are we not able to make predictions for because of the cold start problem?

```
df_train - training dataframe
            df\_test - test dataframe
            OUTPUT:
            user_item_train - a user-item matrix of the training dataframe
                              (unique users for each row and unique articles for each column)
            user_item_test - a user-item matrix of the testing dataframe
                            (unique users for each row and unique articles for each column)
            test_idx - all of the test user ids
            test\_arts - all of the test article ids
            # Your code here
            return user_item_train, user_item_test, test_idx, test_arts
        user_item_train, user_item_test, test_idx, test_arts = create_test_and_train_user_item(d)
In []: # Replace the values in the dictionary below
        a = 662
        b = 574
        c = 20
        d = 0
        sol_4_dict = {
            'How many users can we make predictions for in the test set?': # letter here,
            'How many users in the test set are we not able to make predictions for because of t
            'How many articles can we make predictions for in the test set?': # letter here,
            'How many articles in the test set are we not able to make predictions for because of
        }
        t.sol_4_test(sol_4_dict)
```

5. Now use the **user\_item\_train** dataset from above to find U, S, and V transpose using SVD. Then find the subset of rows in the **user\_item\_test** dataset that you can predict using this matrix decomposition with different numbers of latent features to see how many features makes sense to keep based on the accuracy on the test data. This will require combining what was done in questions 2 - 4.

Use the cells below to explore how well SVD works towards making predictions for recommendations on the test data.

## In []:

6. Use the cell below to comment on the results you found in the previous question. Given the circumstances of your results, discuss what you might do to determine if the recommendations you make with any of the above recommendation systems are an improvement to how users currently find articles?

# Your response here.

### Extras Using your workbook, you could now save your recommendations for each user, develop a class to make new predictions and update your results, and make a flask app to deploy your results. These tasks are beyond what is required for this project. However, from what you learned in the lessons, you certainly capable of taking these tasks on to improve upon your work here!

#### 1.2 Conclusion

Congratulations! You have reached the end of the Recommendations with IBM project!

**Tip**: Once you are satisfied with your work here, check over your report to make sure that it is satisfies all the areas of the <u>rubric</u>. You should also probably remove all of the "Tips" like this one so that the presentation is as polished as possible.

#### 1.3 Directions to Submit

Before you submit your project, you need to create a .html or .pdf version of this note-book in the workspace here. To do that, run the code cell below. If it worked correctly, you should get a return code of 0, and you should see the generated .html file in the workspace directory (click on the orange Jupyter icon in the upper left).

Alternatively, you can download this report as .html via the **File > Download as** submenu, and then manually upload it into the workspace directory by clicking on the orange Jupyter icon in the upper left, then using the Upload button.

Once you've done this, you can submit your project by clicking on the "Submit Project" button in the lower right here. This will create and submit a zip file with this .ipynb doc and the .html or .pdf version you created. Congratulations!
